Conclusions

- NA49 has identified particles in the forward hemisphere with controlled centrality
- Particle production studied using different projectiles, targets and energies

- Gradual stopping
- Correlations – predictions
  could replace the usual comparison to min. bias

- Resonances
  Ξ, $\Lambda(1520)$, $\phi(1020)$
- Energy scan
  40GeV – high strangeness content
- System size
  scaling?

Outlook

- Energy scan
  80GeV taken recently
