# Conclusion and Outlook

- predicted signatures of deconfinement seen at SPS
  - $J/\Psi$ suppression
  - strangeness enhancement (kaons,multistrange hyperons, hidden strangeness $\Phi$ meson)
  - level of strangeness and entropy production as expected with initial QGP stage
  - high degree of kinetic/flavor equilibration
  - hydrodynamic like evolution
- no specific signal from a sharp QGP→HG phase transition
- data suggestive of a transient deconfined phase
